

## Md. Asif Nawaz \_ 30018

if we return b it will through error as we can not return a parameter of a function.

We will need escape keyword to return a function parameter

And the changes we need to make to the code to return b is to adding @escaping keyword shown in bellow -

```
1. func a(b: @escaping () -> ()) -> () -> () {  
2. func c() {  
3. print("c")  
4. }  
5. return c  
6.}  
7.  
8. let result = a{ 9. print("b") 10. }  
11. result()
```

This issue didn't occur when we returned **c** because **c** is nested function and according to the return type of function **a** we can return **c** because **c** is the same function type as the return type of function **a**
